1 Introduction

1.1 Preface
DCSA envisions a digitally interconnected container shipping industry. Our mission is to be the de facto standards body for the industry, setting the technological foundation for interoperable IT solutions. Together with our member carriers, DCSA creates vendor-neutral, technology-agnostic standards for IT and non-competitive business practices. By working towards the widespread adoption of these standards, our aim is to move the industry forward in terms of customer experience, efficiency, collaboration, innovation, and respect for the environment.

Please refer to the DCSA website, https://dcsa.org/about/ for more information.

The objective of the DCSA Data and Interface Standard program is to strengthen the container shipping industry’s ability to send and receive data across all parties in the industry. Furthermore, it aims to enhance inter-carrier cooperation based on shared requirements and to ensure interoperability by using a shared data language. Ideally, this language will be inspired by existing standards and aligned with the process definitions put forth in the DCSA Industry Blueprint.

The standards published by DCSA are technology agnostic. DCSA does not point to the use of specific vendors’ technologies or systems but relies on open-source, shared requirements for the industry that can be used by all parties, regardless of their choice of technology.

This chapter describes the purpose, structure and supporting publications of this document.

1.2 Purpose
The DCSA Information Model has been created to organise and catalogue the information being generated or consumed in connection with the processes described in the DCSA Industry Blueprint. The information model is also used as a collective term to describe all products that model data needed to meet the interface requirements. The information model includes a diagrammatic representation of selected data entities and their relationships with one another.

By standardising the terms used and documenting the related data, the DCSA Information Model is designed to provide a foundation that can be used in the current interface standardisation work and for future initiatives. DCSA recognises that there is a variety of standards that exist today and endeavours to reuse these resources where appropriate within the context of the container shipping industry. Some of these existing standards are more widely adopted than others, such as the UN/CEFACT Multimodal Transport Reference Data Model (MMT RDM). It is the intention of DCSA to constantly evaluate the DCSA Information Model against this and other standards.
1.3 Overview
The DCSA Information Model has been designed to act as a translator between the information requirements identified by the business processes mapped in the DCSA Industry Blueprint and the existing standards for describing reference data relevant to the industry. This helps identify what is already available and where any potential gaps exist that need further investigation. This is depicted in Figure 1 along with how the DCSA Information Model interacts with the different elements.

![Figure 1: The DCSA Information Model as a translator](image)

1.4 Conformance
All parties in the container shipping industry are encouraged to implement and follow the data and interface requirements outlined and specified in this document. The requirements are linked to the UML version 2.0 diagrams for design requirements as well as the Logical Data Model and data definitions for information requirements, which must be implemented to conform to the agreed standards within the DCSA framework.

1.5 Supporting publications
This document is supported by a range of supplementary publications by DCSA, which will be referenced in the relevant sections. The supporting publications are listed in the table below and they can be found on the DCSA website (https://dcsa.org/).
<table>
<thead>
<tr>
<th>Index</th>
<th>Publication</th>
<th>Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>DCSA Glossary of Terms 3.0</td>
<td>This document promotes alignment of terms across all DCSA stakeholders in the container shipping industry. The glossary is published on the DCSA website in the context of the DCSA Industry Blueprint 3.0.</td>
</tr>
<tr>
<td>2</td>
<td>DCSA Industry Blueprint 3.0</td>
<td>This document provides insights into as–is carrier processes. The DCSA Industry Blueprint comprises processes related to the movement of a container/equipment from one location to another, processes that are linked to a shipment/booking, processes that are considered critical for industry digitisation and standardisation efforts, and finally processes that are not considered commercially sensitive or of competitive advantage.</td>
</tr>
<tr>
<td>3</td>
<td>DCSA Event Naming Convention 1.0, and Event Structure Definitions 1.0</td>
<td>Throughout the years, track and trace solutions have become a commonly seen service in the container shipping industry. However, due to misalignment of terminology and ways of working, each carrier has designed its own events that have been published on their websites. To align this across the industry, this document provides a naming convention that sets the standard for naming as well as understanding customer-facing track and trace events.</td>
</tr>
<tr>
<td>4</td>
<td>DCSA Schedule Definitions 1.0</td>
<td>This document provides standardised terminology and definitions with respect to communication of operational deep-sea (inter-regional) vessel schedules between Vessel Sharing Agreement (VSA) partners. The purpose is to facilitate standardisation and accuracy in partner communication and hence reduce the pain-points that carriers raised in this area. It is understood that not all VSA’s (or carriers) apply ALL processes, but for the sake of completeness, the full process definitions are shared with all members. The purpose is to standardise what and when partners communicate (and to whom) with respect to operational vessel schedules and related exception-management. The definitions and time specifications add context to the vessel schedule process maps that have been circulated separately to members.</td>
</tr>
<tr>
<td>5</td>
<td>DCSA Information Model 3.0 Reading Guide</td>
<td>This document helps to set the context for DCSA initiatives. The reading guide provides insight into the different concepts and methods utilised in the production of the Information Model and suggests ways in which the document can be used.</td>
</tr>
</tbody>
</table>
The DCSA Interface Standard for Operational Vessel Schedule has been created to simplify the exchange of vessel schedule-related information between vessel operators, and to support the standardisation of the fundamental information provided across the vessel operator liner domain. The reading guide provides insight into the different concepts and methods utilised in the production of the OVS Interface Standard and suggests ways in which the document can be used as a foundation for future implementations.

The DCSA Interface Standard for Track and Trace 1.2 has been created to standardise the fundamental information provided across the carrier liner domain through track and trace interfaces. The reading guide provides insight into the different concepts and methods utilised in the production of the Track and Trace Interface Standard and suggests ways in which the document can be used as a foundation for future implementations.

The DCSA Interface Standard for Shipping Instruction and Transport Document has been created to simplify the exchange of shipment-related information between shipper and carrier (upon booking confirmation) and to support the standardisation of the documentation process. The standard addresses submission of shipping instruction from the shipper to the carrier and issuance of a transport document by the carrier to a shipper. The reading guide provides insight into the container shipping documentation process and specifically addresses the “prepare bill of lading” and “issue bill of lading” processes for specific transport document types (Bill of Lading or Sea Waybill).

Table 1: Supporting publications
2 DCSA Information Model 3.0
This chapter describes the terms and data types used in this document.

2.1 Introduction
The DCSA Information Model 3.0 refers to the collection of artefacts and products that document and define the reviewed and agreed data standards that must be followed within the DCSA framework. The adoption of the industry standards in the DCSA Information Model 3.0 will help ensure the ongoing standardisation and optimisation of interoperability and data exchange between the parties in the container shipping industry as well as other stakeholders working within the industry.

As depicted in the diagram below, the DCSA Information Model 3.0 consists of the following artefacts and products:

- Logical data model: A diagrammatic representation of:
  - Data entities and the data attributes that store details about the entities;
  - The relationships that exist between data entities;
  - Standardised names of data entities and data attributes, for example, equipment versus container; definitions of the entities and attributes are stored as part of the metadata for the model.

- Standardised lists of data: This is particularly relevant for reference data entities, through which a controlled list of values is recommended to help ensure that the same data are being used within and between organisations.

- Data standardisation rules: When a predetermined data value cannot be offered, the data standardisation rules can help with the generation of consistent data values that can be used.

Figure 2: Overview of the contents of the DCSA Information Model
The DCSA Information Model 3.0 has been designed to support a shared understanding of concepts, terms, and rules within the shipping industry. The principles behind the creation of the model have been to look to the current standards used within the industry and to reuse these standards where appropriate or propose new ones where a usable standard could not be found. The key input for the DCSA Information Model 3.0 includes:

- DCSA Industry Blueprint: Comprises recommended current-state standards for the processes used in container shipping. The terminology used in the Information Model has primarily been aligned with the DCSA Industry Blueprint terminology.
- DCSA Glossary of Terms 3.0: Definitions of terms used across DCSA in an industry-specific language.
- UN/CEFACT models: The Multimodal Transport (MMT) Reference Data Model (RDM) has been used as a key resource to help define and standardize entities within the Logical Data Model.
- SME input: Input from the appointed subject matter experts (SMEs) among the DCSA members.
- Other Standards: DCSA regularly checks which other relevant standards are being used and where possible, will re-use proven standards.

The model deals with industry data at logical and conceptual levels rather than applying physical naming conventions, configured in, for example physical database. Therefore, the DCSA Information Model must be considered as the container shipping industry’s reference data model helping users of the model to understand how data is generated/consumed as a result of the execution of industry processes and how these data can be mapped in a logical way.

### 2.2 Selected data modelling terms defined

The table below provides a definition of selected terms used throughout this document and provides the reader with insight into the meaning of the term and the origin of the definition. Specific terms and definitions that are indispensable for this document may include alternative or reproduced definitions from existing standards, or they may be referenced as a shared understanding within DCSA.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Entity</td>
<td>An object in a data model (e.g. in The Logical Data Model, <em>Equipment</em> is a data entity).</td>
</tr>
<tr>
<td>Information Model</td>
<td>The information model refers to a collection of artefacts and products that help define the information that is relevant to the container shipping industry.</td>
</tr>
<tr>
<td>Logical Data Model</td>
<td>A graphical way of representing a data architecture without regard to the physical implementation or the database management system involved in storing the data, providing information about the various entities or the relationships between the entities.</td>
</tr>
</tbody>
</table>
Reference Data

Reference data is data that defines the set of permissible values to be used by the data entities. Reference data is typically a class of data commonly referred to as code tables or look-up tables generally consisting of three attributes: a code, a name, and a description. Reference data may be described as any kind of data that is used to categorise other data.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reference Data</td>
<td>Reference data is data that defines the set of permissible values to be used by the data entities. Reference data is typically a class of data commonly referred to as code tables or look-up tables generally consisting of three attributes: a code, a name, and a description. Reference data may be described as any kind of data that is used to categorise other data.</td>
</tr>
</tbody>
</table>

Table 2: Selected data modelling terms

2.3 The DCSA Information Model data types and formats

For each data attribute, which the Logical Data Model points to, a data type has been selected to provide additional details that have already been identified. An overview of the different data types utilised is presented in the table below. When the data type is selected, the reasoning below is applicable throughout this document.

<table>
<thead>
<tr>
<th>Data type</th>
<th>Usage rule</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text</td>
<td>The Text data type stores strings in a variable-length field. Data can consist of letters, numbers, and symbols. In cases where there is a maximum number of characters allowed, this will be stated by capturing the maximum numbers of characters allowed, in brackets, e.g. Text(100) is used when the length of the data field can vary, up to a maximum of 100 characters.</td>
</tr>
<tr>
<td>Number</td>
<td>The Number data type represents a number, potentially decimal, i.e. with digits after the decimal point.</td>
</tr>
</tbody>
</table>
DateTime

A DateTime is only meaningful in relation to a specific location. The DateTime attribute should always be specified as UTC or with a UTC Offset to provide context as to which time zone (location) the DateTime relates to. If no UTC-related offset is given, the time is assumed to be in local time.

However, this might result in ambiguity and confusion when used across time zones or even within the same time zone if the region observes daylight saving time (DST). If the time is provided in UTC, append a Z directly after the time. Z (also ‘Zulu’ time zone) is the zone designator for UTC±00:00: ‘YYYY-MM-DDThh:mm:ssZ’. Negative UTC offsets describe a time zone west of UTC±00:00, where the time is behind UTC.

For example, Quito is five hours behind UTC, so the time zone designator is ‘−05:00’. The DateTime ‘2019-12-31T12:00:00−05:00’ and ‘2019-12-31T17:00:00Z’ describe the same point in time in Quito. Positive UTC offsets describe a time zone east of UTC±00:00, where the time is ahead of UTC. For example, Luanda is one hour ahead of UTC, so the time zone designator is ‘+01:00’. The DateTime ‘2019-12-31T12:00:00+01:00’ and ‘2019-12-31T11:00:00Z’ describe the same point in time in Luanda. The plus sign must be used for a positive or zero UTC offset, and a minus sign for a negative UTC offset. Hence the UTC offset −00:00 is not permitted.

For London, the time zone designator would be +00:00 (not −00:00), and +01:00 during daylight saving time.

DateTime format without UTC-related offset (local time): ‘YYYY-MM-DDThh:mm:ss’.

DateTime format with UTC Offset: ‘YYYY-MM-DDThh:mm:ss±hh:mm’.

DateTime format in UTC: ‘YYYY-MM-DDThh:mm:ssZ’.

Boolean

The Boolean data type is used to specify a true or false value.

---

### Table 3: Data type overview

<table>

Negative UTC offsets describe a time zone west of UTC±00:00, where the time is behind UTC. For example, Quito is five hours behind UTC, so the time zone designator is ‘−05:00’. The DateTime ‘2019-12-31T12:00:00−05:00’ and ‘2019-12-31T17:00:00Z’ describe the same point in time in Quito. Positive UTC offsets describe a time zone east of UTC±00:00, where the time is ahead of UTC. For example, Luanda is one hour ahead of UTC, so the time zone designator is ‘+01:00’. The DateTime ‘2019-12-31T12:00:00+01:00’ and ‘2019-12-31T11:00:00Z’ describe the same point in time in Luanda. The plus sign must be used for a positive or zero UTC offset, and a minus sign for a negative UTC offset. Hence the UTC offset −00:00 is not permitted. For London, the time zone designator would be +00:00 (not −00:00), and +01:00 during daylight saving time. DateTime format without UTC-related offset (local time): ‘YYYY-MM-DDThh:mm:ss’. DateTime format with UTC Offset: ‘YYYY-MM-DDThh:mm:ss±hh:mm’. DateTime format in UTC: ‘YYYY-MM-DDThh:mm:ssZ’.</td>

<tr>
<td>Boolean</td>
<td>The Boolean data type is used to specify a true or false value.</td>
</tr>
</tbody>
</table>

### 2.3.1 Attribute naming conventions

To maintain consistency in the Logical Data Model, certain labels are used repeatedly to make the meaning of these attributes a bit clearer.

Generally, for entities that hold reference data, the following suffixes will be used:

- Code
- Name
- Description

The table below shows a selection of the labels that certain types of attributes use consistently.
<table>
<thead>
<tr>
<th>Format</th>
<th>Format usage rule</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code</td>
<td>(For reference data entities) A business code used to uniquely identify each row. These codes may be recognisable by the business community and therefore have a business meaning.</td>
</tr>
<tr>
<td>Name</td>
<td>(For reference data entities) A short description of what the reference data value is; this is the value that will usually be used in reporting.</td>
</tr>
<tr>
<td>Description</td>
<td>(For reference data entities) In cases where an addition explanation may be beneficial, a description may be included.</td>
</tr>
<tr>
<td>ID</td>
<td>An identifier used to make the model easier to understand and preserve relationships. These are not real-world business keys but are in some cases intended to be referenced by the interface standards.</td>
</tr>
<tr>
<td>DateTime</td>
<td>In the current version of the model, the DateTime suffix and data type is used to denote instances where only a date needs to be captured and where both the date and the time needs to be captured. This is to allow for flexibility, given the variances in how data may be stored by different organisations. If only the date is captured, the time part will consist of zeros for HH:MM:SS (00:00:00). Note: A UTC-related offset should not be specified because these are only meaningful in combination with a time. The date is assumed to be local in relation to the location the date is referring to.</td>
</tr>
</tbody>
</table>

Table 4: Data attribute naming conventions
3 Logical Data Model

The Logical Data Model of the DCSA Information Model 3.0 is presented at an entity level in the figure below.

The entities in the Logical Data Model can be split into the following two categories:

1. Entities (light grey)
2. Reference data entities (dark grey)

The Logical Data Model details the entities and their relationships with one another. An entity is an object that can have information stored about it, for example, Shipment, Equipment, and Transport. A relation describes the industry data-related rules between two entities.

In many cases, entity data is generated as unique transactional records, for example, a booking whose data cannot be predetermined in the same way that reference data can. However, it is important for DCSA to point to specific formats or conventions that can be followed to avoid duplicated information (for example, two unique instances of equipment with the same reference number) or incompatible data formats (for example, conflicting date formats such as 2 March 2010 written as 02/03/2010 versus 2010-03-02). Regarding reference data, a holistic dataset (list of values) will be described to ensure that the data is accurate and will yield the same results no matter who uses them. Within each subject area in the subsequent sections, the reference data, which DCSA recommends, will be cited. In cases where a standard already exists, and it has been agreed within DCSA to utilise the standard, it will be referenced; otherwise it will be specified where a new dataset is created.
In general, the Logical Data Model is a work-in-progress model, limited in size by the scope of each release. Therefore, the model will transform and grow over time and, for example, cover more breadth per relevant subject area in subsequent releases.
4 Logical Data Model usage

The DCSA Information Model 3.0 has been designed to act as a translator between the information requirements identified by the business processes mapped in the DCSA Industry Blueprint, and the existing standards for describing reference data relevant to the industry. The model has been built iteratively, with focus being given to certain parts of the model that are relevant to fulfil track and trace, operational vessel schedule and electronic bill of lading interface requirements. Therefore, certain sections of the model will be more advanced than others, although the model has evolved and will continue to evolve over time. The aim of this section is to highlight the relevant parts of the model that have been developed for specific requirements.

The DCSA Information Model was originally constructed around the requirements for the ability to track and trace a shipment. Afterwards, it was extended to support an interface to share Operational Vessel Schedules (OVS) between vessel sharing agreement (VSA) partners. The model has recently undergone another iteration to support an interface to share bill of lading information electronically between carriers, shippers, and other potential stakeholders in the supply chain. These areas will be described further in their own sections.

4.1 Track and trace (T&T)

The entities that are needed to fulfil the requirements to be able to track and trace a shipment are shown in the figure below.
The objective behind the use case of tracking and tracing a shipment is to identify the equipment and the transportation modes used for moving goods, rather than tracking and tracing the goods themselves or the contents of the equipment used in fulfilling the shipment.

The key entities are:

- **Shipment**: Uniquely identifies the shipment that needs to be tracked and traced.
- **Equipment**: Identifies the equipment(s) used to transport the goods belonging to the shipment.
- **Transport**: Identifies which modes of transport (truck, rail, vessel, or barge) are involved in the shipment.
- The three Event (Transport/Shipment/Equipment) entities: ‘Shipment events’ describe actions that occurred or have been planned to occur in relation to a booking or transport document, such as the booking confirmation. ‘Transport events’ describe the movements of the transport instances that are associated with the particular shipment or equipment item. ‘Equipment events’ describe the movements of an equipment item as part of the freight transportation. The previous sections in this document have outlined these elements.

For tracking and tracing, the primary parties are:

- The sender/receiver (shipper/consignee) of goods wanting to maintain information about the goods being transported. The details of these parties are stored in the Shipment entity.
- The main party contracting the movement of the goods, which, from DCSA’s point of view, is the ocean carrier. The Carrier entity stores the details of this party.

### 4.2 Operational vessel schedules (OVS)

The entities that are needed to fulfil the requirements of sharing operational vessel schedules are shown in the figure below:
In addition to track and trace, the Logical Data Model (LDM) includes a standard of information relevant for operational vessel schedules. The focus is on container liner long-term and coastal schedules, i.e. schedules that have a named vessel assigned to them. Although proforma schedules are not covered by the current release, the LDM has modelled the Service and Service Proforma entities for completeness and additional context, with the expectation that these will be further developed in the future. Hence, the Service Proforma entity simply represents the latest version of the proforma, not accounting for historical amendments. Likewise, VSAs have been modelled with minimal details to simply provide the context for how the operational vessel schedules are ultimately related to existing vessel sharing agreements.

The following are currently not in scope:
- Commercial schedules;
- Feeder schedules;
- Liner schedules that are not part of VSAs.

The model for OVS revolves around vessel-related events. It mainly concerns the vessel operator (how the shipment in practice is transported from the origin to the destination). This customer-provider relationship is naturally expressed through products. The transport plans of the products are modelled by the shipment transport entity which describes how the shipment is routed through the liner network.
The OVS requirements heavily focus on the transport and transport journey subject areas. Although for the track and trace requirements, the generic transport entities were sufficient, OVS needs additional details which have been modelled as sub-type entities of Vessel and Voyage.

4.3 eDocumentation

The entities that are needed to fulfil the requirements to encompass the documentation process are shown in the figure below.

As part of the B/L standardisation initiative several new entities have been added to the IM to encompass the documentation process. The purpose is to enable the process coverage from booking confirmation to issuance of transport document while capturing all the relevant information details, excluding dangerous goods and out-of-gauge, from both an operational and a documentation perspective. The process coverage from booking request to booking confirmation will be addressed in a later release.

The IM has been updated to reflect the relationship between booking, shipment, cargo items, shipping instruction and transport document, as well as the physical relation between the container, vessel, and transport plan. Parties have been added to capture shipper, consignee and notify parties on a booking, shipment, and transport document. The model further addresses how individual cargo items are stuffed into containers in relation to the shipping instruction and respective transport documents. A many-to-many relation between shipment and transport document is created through cargo items and shipping instruction. The model encompasses the
The fact that transport documents, i.e. Seaway Bill and Bill of Lading, can be issued both physical and digitally (eBL) as well as negotiable or non-negotiable.

Lastly, the model now aligns with the UN/CEFACT MMT reference data model in terms of defining shipment in relation to a booking as well as shipment in relation to a transport document (consignment in UN/CEFACT terms).
5 Subject areas in the Logical Data Model

The Logical Data Model is split into subject areas to provide a more focused overview of each part of the model, as illustrated in the figure below. Each subject area consists of one or more data entities and the related reference data.

In the following sections, each of the subject areas and their relating data entities and data attributes will be described in the following order:

1. Shipment
2. Transport Document
3. Party
4. Charges
5. Equipment
6. Stuffing
7. Location
8. Transport
9. Events
10. Vessel Sharing Agreement (VSA)
11. Service
12. Transport Journey

Within each subject area, an overview of and insight into the reference data values are provided. Where an existing reference data standard is reused, the source will be stated. Otherwise, an alternative will be specified. All reference data entities will be described in relation to the subject areas that they are part of.
5.1 Shipment

The subject area of Shipment contains seven entities: Shipment, Booking, Requested Equipment, Reference Type, References, Service Type and Shipment Term. The Shipment related entities are shown in Figure 8.

The term shipment has been defined in accordance with the DCSA Industry Blueprint and relates directly to the booking confirmation sent by a carrier to a customer. A shipment is an identifiable collection of one or more Cargo Items (available to be) transported together from the Seller(s) (Original Consignor/Shipper) to the Buyer(s) (Final/Ultimate Consignees). A shipment may form a part or all of a transport document (UN/CEFACT Consignment) or may be transported in different transport documents. As such, the definition of a shipment aligns with the UN/CEFACT MMT reference data model.

The Shipment subject area and its entities will allow for the identification of the shipment that a user may want to track. A shipment must be assigned to one and only one carrier (as defined by the Carrier ID).

![Figure 8: Shipment subject area](image)

The entities within the Shipment subject area are defined and detailed in the following tables.
**Shipment entity:** an identifiable collection of one or more Cargo Items (available to be) transported together from the Seller(s) (Original Consignor/Shipper), to the Buyer(s) (Final/Ultimate Consignee).

<table>
<thead>
<tr>
<th>Attribute</th>

5.1.1 Shipment reference data

The figure below shows the reference data entities in the Shipment subject area.

![Diagram of Shipment reference data entities]

Table 12 contains the service types defined by DCSA. They are both applicable to export and import e.g. CY / CY.

<table>
<thead>
<tr>
<th>Service Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CY</td>
<td>Container yard (incl. rail ramp), where the carrier takes possession of a fully stuffed container delivered by the customer at the carrier or carrier’s appointed supplier’s facility or where a container is released to the customer by the carrier.</td>
</tr>
<tr>
<td>SD</td>
<td>Store door, indicating that the carrier is taking possession of or delivers a fully stuffed container at the customer’s appointed premises.</td>
</tr>
<tr>
<td>CFS</td>
<td>Container freight station, indicating that the carrier has received the cargo and is responsible for stuffing of the cargo within the container or the customer receives the cargo directly from the container freight station.</td>
</tr>
</tbody>
</table>

Table 13 contains the shipment terms defined by DCSA.
Shipment Term | Description
---|---
FCL | Full Container Load: the shipper/ consignee or its agent or subcontractor is responsible for stuffing or stripping the cargo into or out of the container and bears every responsibility and liability in such respect.

LCL | Less than Container Load: the carrier or its agent or subcontractor is responsible for stuffing or stripping the cargo into or out of the container and bears every responsibility and liability in such respect.

BB | Break bulk: indicates that the carrier has received the cargo which is not containerised.

Table 14: Reference Type

5.2 Transport Document

The subject area of Transport Document contains seven entities: Shipping Instruction, Transport Document, Transport Document Type, EBL Endorsement Chain, Transport Document Carrier Clauses, Document Version and Carrier Clauses. These entities are shown in Figure 10. A shipping instruction is an enrichment to the original booking shared by the shipper to the carrier. The shipping instruction includes cargo items, specified by volume or weight, packages, etc. The
information given by the shipper through the shipping instruction is the information required to create and update a transport document. A transport document is a contractual document issued to the shipper which confirms the carrier’s receipt of the cargo, acknowledging goods being shipped or received for shipment and specifying the terms of delivery (as one of the evidences of the contract of carriage). The Transport Document is prepared based on shipping instructions, including cargo description, given by the shipper on forms issued by the carrier and is the title to the goods and can be a negotiable document. It relates directly to the concept of a consignment as published in the UN/CEFACT MMT reference data model.

The entities within the Transport Document subject area are defined and detailed in the following tables.

**Transport document entity:** relates to the type and key attributes of the contract of carriage.
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transport Document ID</td>
<td>The unique identifier of a transport document.</td>
<td>UUID</td>
</tr>
<tr>
<td>Place of Issue</td>

**Table 21: Transport Document Type entity**

5.2.1 **Transport Document reference data**

The figure below shows the reference data entities in the Transport Document subject area.
Table 22 contains transport document type codes, names and descriptions.

<table>
<thead>
<tr>
<th>Transport Document Type Code</th>
<th>Transport Document Type Name</th>
<th>Transport Document Type Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOL</td>
<td>Bill of Lading</td>
<td>Contractual document issued to the shipper which confirms the carrier's receipt of the cargo, acknowledging goods being shipped or received for shipment and specifying the terms of delivery (as one of the evidences of the contract of carriage). The Bill of Lading is usually prepared based on shipping instructions, including cargo description, given by the shipper on forms issued by the carrier and is the title to the goods and can be a negotiable document.</td>
</tr>
<tr>
<td>SWB</td>
<td>Sea Waybill</td>
<td>A separate specific transport document type which is non-negotiable, does not transfer title, but which evidences the contract of carriage and receipt of the goods. It must be issued to a named consignee and can be both in a physical or digital format. Goods can be released at destination without presenting the original sea waybill as proof of ownership.</td>
</tr>
</tbody>
</table>

The transport document type is requested by the shipper at time of SI submission and must be one of the above types.

**Transport Document version reference data:** addresses the status and version of a specific transport document or shipping instruction and links to the shipment events in table 78.
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Shipment event type code</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Received</td>
<td>Indicates that a document is received by the carrier or shipper.</td>
<td>RECE</td>
<td>Text</td>
</tr>
<tr>
<td>Drafted</td>
<td>Indicates that a document is in draft mode being updated by either the shipper or the carrier.</td>
<td>DRFT</td>
<td>Text</td>
</tr>
<tr>
<td>Pending Approval</td>
<td>Indicates that a document has been submitted by the shipper or carrier and is now awaiting approval by the counterpart.</td>
<td>PENA</td>
<td>Text</td>
</tr>
<tr>
<td>Pending Update</td>
<td>Indicates that the carrier requested an update from the shipper which is not received yet.</td>
<td>PENU</td>
<td>Text</td>
</tr>
<tr>
<td>Rejected</td>
<td>Indicates that a document has been rejected by the carrier.</td>
<td>REJE</td>
<td>Text</td>
</tr>
<tr>
<td>Approved</td>
<td>Indicates that a document has been approved by the counterpart.</td>
<td>APPR</td>
<td>Text</td>
</tr>
<tr>
<td>Issued</td>
<td>Indicates that a document has been issued by the carrier.</td>
<td>ISSU</td>
<td>Text</td>
</tr>
<tr>
<td>Surrendered</td>
<td>Indicates that a document has been surrendered by the customer to the carrier.</td>
<td>SURRE</td>
<td>Text</td>
</tr>
<tr>
<td>Submitted</td>
<td>Indicates that a document has been submitted by the customer to the carrier.</td>
<td>SUBM</td>
<td>Text</td>
</tr>
<tr>
<td>Void</td>
<td>Cancellation of an original transport document.</td>
<td>VOID</td>
<td>Text</td>
</tr>
</tbody>
</table>

Table 23: Transport Document version reference data entity
5.3 Party
A party refers to a company or legal entity represented on the Transport Document as a party to a shipment. The Party subject area contains four entities: Party, Party Function, Document Party and Carrier. These entities are shown in Figure 12.

The entities within the Party subject area are defined and detailed in the following tables.

**Party entity**: refers to a company or a legal entity.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Party ID</td>
<td>Identifier of a party.</td>
<td>UUID</td>
</tr>
<tr>
<td>Party Name</td>
<td>Name of the party.</td>
<td>Text(100)</td>
</tr>
<tr>
<td>Tax Reference 1</td>
<td>The identifying number of the consignee or shipper (Individual or entity) used for tax purposes.</td>
<td>Text(20)</td>
</tr>
</tbody>
</table>

Figure 12: Party subject area
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tax Reference 2</td>
<td>Optional second identifying number of the consignee or shipper (individual or entity) used for tax purposes.</td>
<td>Text(20)</td>
</tr>
<tr>
<td>Public Key</td>
<td>The public key used for a digital signature.</td>
<td>Text(500)</td>
</tr>
<tr>
<td>Street name</td>
<td>The name of the street of the party’s address.</td>
<td>Text(100)</td>
</tr>
<tr>
<td>Street number</td>
<td>The number of the street of the party’s address.</td>
<td>Text(50)</td>
</tr>
<tr>
<td>Floor</td>
<td>The floor of the party’s street number.</td>
<td>Text(50)</td>
</tr>
<tr>
<td>Postal code</td>
<td>The postal code of the party’s address.</td>
<td>Text(10)</td>
</tr>
<tr>
<td>City name</td>
<td>The city name of the party’s address.</td>
<td>Text(65)</td>
</tr>
<tr>
<td>StateRegion</td>
<td>The state/region of the party’s address.</td>
<td>Text(65)</td>
</tr>
<tr>
<td>Country</td>
<td>The country of the party’s address.</td>
<td>Text(75)</td>
</tr>
<tr>
<td>NMFTA Code</td>
<td>The Standard Carrier Alpha Code (SCAC) provided by NMFTA.</td>
<td>Text(4)</td>
</tr>
</tbody>
</table>

Table 24: Party entity

**Document Party entity:** stores the parties involved in the transport document.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shipping Instruction ID</td>
<td>The identifier for a shipping instruction provided by the carrier for system purposes. The attribute Shipping Instruction ID cannot be used in parallel with Shipment line ID.</td>
<td>UUID</td>
</tr>
</tbody>
</table>
### Document Party entity

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Party ID</td>
<td>Links to a party related to the transport document.</td>
<td>UUID</td>
</tr>
<tr>
<td>Shipment ID</td>
<td>Links to a shipment. The attribute Shipment ID cannot be used in parallel with Shipping Instruction ID.</td>
<td>UUID</td>
</tr>
<tr>
<td>Party function</td>
<td>Specifies the role of the party in the context of the given Shipping Instruction.</td>
<td>Text(3)</td>
</tr>
<tr>
<td>Displayed Address</td>
<td>The address of the party to be displayed on the transport document.</td>
<td>Text(250)</td>
</tr>
<tr>
<td>Party Contact Details</td>
<td>The contact details of the person to contact in relation to the Transport Document (changes, notifications etc.).</td>
<td>Text(250)</td>
</tr>
<tr>
<td>Should Be Notified</td>
<td>Used to decide whether the party will be notified of the arrival of the cargo.</td>
<td>Boolean</td>
</tr>
</tbody>
</table>

Table 25: Document Party entity

### Carrier entity

**Carrier entity:** an organisation or government undertaking the transport of goods. The term includes both carriers for hire or reward (also known as common or contract carriers in some countries) and carriers on own account (known as private carriers in some countries).

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Carrier ID</td>
<td>Unique internal identifier for the carrier.</td>
<td>UUID</td>
</tr>
<tr>
<td>Carrier Name</td>
<td>The name of the carrier.</td>
<td>Text(100)</td>
</tr>
<tr>
<td>SMDG Code</td>
<td>The Liner code provided by SMDG for the Carrier.</td>
<td>Text(3)</td>
</tr>
<tr>
<td>NMFTA Code</td>
<td>The Standard Carrier Alpha Code (SCAC) provided by NMFTA for the carrier.</td>
<td>Text(4)</td>
</tr>
</tbody>
</table>

Table 26: Carrier entity

**Party Function entity:** defines the role of the party in the context of the transport document or the shipment.
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Party Function Code</td>
<td>The party function code is the code to give specific meaning to a party.</td>
<td>Text(3)</td>
</tr>
<tr>
<td>Party Function Name</td>
<td>The name of the specific role, e.g. Consignee, Freight Forwarder, etc.</td>
<td>Text(100)</td>
</tr>
<tr>
<td>Party Function Description</td>
<td>A description of the party function.</td>
<td>Text(250)</td>
</tr>
</tbody>
</table>

Table 27: Party Function entity

5.3.1 Party reference data
The figure below shows the reference data entities in the Party subject area.

Table 28 contains examples of the unique Carrier Codes, Carrier Names and the carrier codes provided by the Code List Provider and the Code List Provider.

The Carrier entity has been designed to accommodate reference data from two separately maintained data sets: the SMDG Liner Code List (where the Code List Provider value will be set to “SMDG”) and the NMFTA SCAC code list (where the Code List Provider value will be set to “NMFTA”).

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>N1</td>
<td>First Notify Party</td>
<td>The first party which is to be notified.</td>
</tr>
<tr>
<td>N2</td>
<td>Second Notify Party</td>
<td>The second party which is to be notified.</td>
</tr>
<tr>
<td>SFA (Defined by DCSA)</td>
<td>Shipper Forwarding Agent</td>
<td>Forwarding agent that acts on behalf of the shipper.</td>
</tr>
<tr>
<td>CFA (Defined by DCSA)</td>
<td>Consignee Forwarding Agent</td>
<td>Forwarding agent that acts on behalf of the consignee.</td>
</tr>
</tbody>
</table>

#### 5.4 Charges

The subject area of Charges relates to the monetary value of freight and other service charges for a shipment and contains only one entity as shown in the figure below.

**Charges** entity: addresses the monetary value of freight and other service charges for a transport document.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Charges ID</td>
<td>The identifier of a charge.</td>
<td>UUID</td>
</tr>
<tr>
<td>Attribute</td>
<td>Definition</td>
<td>Data type</td>
</tr>
<tr>
<td>---------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-----------</td>
</tr>
<tr>
<td>Transport document ID</td>
<td>The unique identifier of the transport document that the charge concerns.</td>
<td>UUID</td>
</tr>
<tr>
<td>Shipment ID</td>
<td>The unique identifier of the shipment that the charge concerns.</td>
<td>UUID</td>
</tr>
<tr>
<td>Charge Type</td>
<td>Description of the charge type applied.</td>
<td>Text(20)</td>
</tr>
<tr>
<td>CurrencyAmount</td>
<td>The monetary value of all freight and other service charges for a transport document, with a maximum of 2-digit decimals.</td>
<td>Number</td>
</tr>
<tr>
<td>Currency code</td>
<td>The currency for the charge, using a 3-character code (ISO 4217).</td>
<td>Text(3)</td>
</tr>
<tr>
<td>Payment Term</td>
<td>An indicator of whether a charge is prepaid or collect, using a 3-character code to identify INCO terms.</td>
<td>Text(3)</td>
</tr>
<tr>
<td>Calculation Basis</td>
<td>The code specifying the measure unit used for the corresponding unit price for this cost, such as per day, per ton, per square metre.</td>
<td>Text(50)</td>
</tr>
<tr>
<td>Freight Payable At</td>
<td>Location where payment will take place by the customer. Usually refers to Basic Ocean Freight alone. This attribute links to the Location ID.</td>
<td>UUID</td>
</tr>
<tr>
<td>IsChargeDisplayed</td>
<td>An indicator of whether the charge is displayed.</td>
<td>Boolean</td>
</tr>
<tr>
<td>UnitPrice</td>
<td>The unit price of this charge item in the currency of the charge.</td>
<td>Number</td>
</tr>
<tr>
<td>Quantity</td>
<td>The amount of unit for this charge item.</td>
<td>Number</td>
</tr>
</tbody>
</table>

Table 30: Charges entity
5.5 Equipment
The subject area of Equipment contains 2 entities: Equipment, ISO Equipment Code. These entities are shown in Figure 15.

The equipment subject area is modelled to ensure that a specific equipment can be identified and detailed appropriately in terms of type and size in accordance with ISO 6346:1995 Freight containers – Coding, identification and marking and amendment 3 (2012) to ISO 6346:1995. Whenever ISO 6346:1995 is mentioned as a reference in this document, it all instances of equipment that can be used to fulfil a shipment. Each piece of equipment can be categorised according to its type and size, and this information is contained in a hierarchy of reference tables based on ISO 6346. The ISO Equipment Code entity brings together reference data regarding equipment size and type. The entities within the Equipment subject area are defined and detailed in the following tables.

**Equipment entity**: used for storing cargo in/on during transport. The equipment size/type is defined by the ISO 6346 code. The most common equipment size/type is 20'/40'/45' Dry Freight Container, but several different versions exist.
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Equipment Reference</td>
<td>The unique identifier for the equipment, which should follow the BIC ISO Container Identification Number where possible. According to ISO 6346, a container identification code consists of a 4-letter prefix and a 7-digit number (composed of a 3-letter owner code, a category identifier, a serial number, and a check-digit). If a container does not comply with ISO 6346, it is suggested to follow Recommendation #2 “Container with non-ISO identification” from SMDG.</td>
<td>Text(15)</td>
</tr>
<tr>
<td>ISO Equipment Code</td>
<td>Unique code for the different equipment size/type used for transporting commodities. The code is a concatenation of ISO Equipment Size Code and ISO Equipment Type Code A and follows the ISO 6346 standard.</td>
<td>Text(4)</td>
</tr>
<tr>
<td>Tare Weight</td>
<td>The weight of an empty container (gross container weight).</td>
<td>Number</td>
</tr>
<tr>
<td>Weight Unit</td>
<td>The unit of measure; it can be in either Kilograms or Pounds as provided by the shipper.</td>
<td>Text(3)</td>
</tr>
</tbody>
</table>

Table 31: Equipment entity
**ISO Equipment Code entity**: contains the ISO Equipment Code which identifies equipment based on different sizes, types, and purposes, for example, 20-foot reefer container, and follows the ISO 6346 standard.

<table>
<thead>
<tr>
<th>Attributes</th>
<th>Definitions</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISO Equipment Code</td>
<td>Unique code for the different equipment size/type used for transporting commodities. The code is a concatenation of ISO Equipment Size Code and ISO Equipment Type Code A and follows the ISO 6346 standard.</td>
<td>Text(4)</td>
</tr>
<tr>
<td>ISO Equipment Name</td>
<td>Textual description for the equipment, follows the ISO 6346 standard.</td>
<td>Text(35)</td>
</tr>
<tr>
<td>ISO Equipment Size Code</td>
<td>ISO size code designation; two alphanumeric characters used to designate the size code of a piece of equipment.</td>
<td>Text(2)</td>
</tr>
<tr>
<td></td>
<td>- The first character represents the length.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- The second character represents the width and the height.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The size code follows the ISO 6346 standard.</td>
<td></td>
</tr>
<tr>
<td>ISO Equipment Type Code A</td>
<td>Code for the different container types used for transporting commodities. For containers designed and tested with full stacking (minimum superimposed mass of 192,000 kilos) and racking (minimum transverse force of 150 kN) capabilities. Superimposed mass is as defined in ISO 1496-1:1990.</td>
<td>Text(2)</td>
</tr>
<tr>
<td></td>
<td>The code follows the ISO 6346 standard.</td>
<td></td>
</tr>
</tbody>
</table>

Table 32: ISO Equipment Code entity

5.5.1 **Equipment reference data**  
The figure below shows the reference data entity in the Equipment area.

![ISO Equipment Code](image)

Figure 16: Equipment reference data entity
Table 33 contains examples of ISO 6346 equipment codes. This list is a small part of the full list of ISO 6346 equipment codes and names. There are more than 15,000 unique equipment code combinations (not including ISO equipment type code B).

<table>
<thead>
<tr>
<th>ISO Equipment Code</th>
<th>ISO Equipment Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>10G0</td>
<td>10ft General purpose container Without ventilation Opening(s) at one end or both ends.</td>
</tr>
<tr>

<td>20ft Thermal container Self-powered refrigerated/heated Mechanically refrigerated.</td>
</tr>
<tr>
<td>45P7</td>
<td>40ft Platform (container) Platform-based container for named cargo Car carrier.</td>
</tr>
</tbody>
</table>

Table 33: ISO Equipment Code, examples

5.6 Stuffing

The subject area of Stuffing describes the activity of putting cargo items into a container and recording the number of packages/parcels in the shipping instruction to be published on the transport document. It contains nine entities: Cargo Item, Cargo line item, Shipment Equipment, Active Reefer Settings, Seal, Seal Source and Seal Type, HS Code and Package Code. These entities are shown in Figure 17.

Figure 17: Stuffing subject area

---

1 NEN Standards Products & Services has granted DCSA the permission to use the ISO 6346 equipment code examples in this publication.
The entities within the Stuffing subject area are defined and detailed in the following tables.

**Shipment Equipment entity:** specifies the container assigned to a shipment.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shipment Equipment ID</td>
<td>The identifier of the assignment of a container to a shipment.</td>
<td>UUID</td>
</tr>
<tr>
<td>Shipment ID</td>
<td>Identifies the associated shipment.</td>
<td>UUID</td>
</tr>
<tr>
<td>Equipment Reference</td>
<td>Identifies the assigned equipment (container) to the shipment.</td>
<td>Text(15)</td>
</tr>
<tr>
<td>Verified Gross Mass</td>
<td>A declaration informing the carrier of the weight of the container, verified by an authorised person from the shipper or on behalf of said shipper. This includes cargo weight, bracing, dunnage and container tare weight.</td>
<td>Text(250)</td>
</tr>
</tbody>
</table>

Table 34: Shipment Equipment entity

**Active Reefer Settings entity:** specifies the settings for an active reefer container used to a shipment.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shipment Equipment ID</td>
<td>The identifier of the assignment of a container to a shipment.</td>
<td>UUID</td>
</tr>
<tr>
<td>TemperatureMin</td>
<td>Indicates the minimum temperature setting on the container.</td>
<td>Number</td>
</tr>
<tr>
<td>TemperatureMax</td>
<td>Indicates the maximum temperature setting on the container.</td>
<td>Number</td>
</tr>
<tr>
<td>Temperature Unit</td>
<td>Celsius (CEL) or Fahrenheit (FAH).</td>
<td>Text(3)</td>
</tr>
<tr>
<td>HumidityMin</td>
<td>Indicates the minimum humidity setting on the container in percent.</td>
<td>Number</td>
</tr>
</tbody>
</table>
### Active Reefer Settings entity

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>

<td>Indicates the maximum humidity setting on the container in percent.</td>
<td>Number</td>
</tr>
<tr>
<td>VentilationMin</td>
<td>Indicates the minimum ventilation setting on the container in CBM/Hr.</td>
<td>Number</td>
</tr>
<tr>
<td>VentilationMax</td>
<td>Indicates the maximum ventilation setting on the container in CBM/Hr.</td>
<td>Number</td>
</tr>
</tbody>
</table>

Table 35: Active Reefer Settings entity

**Cargo Item entity:** addresses the cargo items to be stuffed into a container for a shipment. A cargo item cannot be split across containers.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cargo Item ID</td>
<td>Identifies the cargo item to be stuffed.</td>
<td>UUID</td>
</tr>
<tr>
<td>Shipment ID</td>
<td>Identifies the associated shipment.</td>
<td>UUID</td>
</tr>
<tr>
<td>Description of Goods</td>
<td>The cargo description are details which accurately and properly describe the cargo being shipped in the container(s) as provided by the shipper.</td>
<td>Text</td>
</tr>
<tr>
<td>HS Code</td>
<td>Used by customs to classify the product being shipped. Can be either 4, 6, 8 or 10 characters long</td>
<td>Text(10)</td>
</tr>
<tr>
<td>Weight</td>
<td>The total weight of the cargo including packaging items being carried in the container(s). Excludes the tare weight of the container(s).</td>
<td>Number</td>
</tr>
<tr>
<td>Volume</td>
<td>Calculated by multiplying the width, height, and length of the packed cargo.</td>
<td>Number</td>
</tr>
<tr>
<td>Weight Unit</td>
<td>The unit of measure which can be expressed in imperial or metric terms as provided by the shipper.</td>
<td>Text(3)</td>
</tr>
<tr>
<td>Attribute</td>
<td>Definition</td>
<td>Data type</td>
</tr>
<tr>
<td>----------------------------</td>
<td>---------------------------------------------------------------------------</td>

</tr>
<tr>
<td>Volume Unit</td>
<td>The unit of measure which can be expressed in either imperial or metric terms as provided by the shipper.</td>
<td>Text(3)</td>
</tr>
<tr>
<td>Number of Packages</td>
<td>Specifies the number of packages associated with this cargo item.</td>
<td>Number</td>
</tr>
<tr>
<td>Shipping Instruction ID</td>
<td>The identifier for a shipping instruction provided by the carrier for system purposes.</td>
<td>UUID</td>
</tr>
<tr>
<td>Package Code</td>
<td>The unique identifier for the package type</td>
<td>Text(3)</td>
</tr>
<tr>
<td>Shipment Equipment ID</td>
<td>The identifier of the assignment of a container to a shipment.</td>
<td>UUID</td>
</tr>
</tbody>
</table>

Table 36: Cargo Item entity

**Cargo Line Item entity:** identifies the specific details of packages within a cargo item.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cargo line item ID</td>
<td>Identifies the cargo line item (package) within the cargo.</td>
<td>Text</td>
</tr>
<tr>
<td></td>
<td>The cargo line item ID is provided by the shipper and is used to define the stuffing. Cargo line items belonging to the same cargo items are stuffed in the same container.</td>
<td></td>
</tr>
<tr>
<td>Cargo item ID</td>
<td>Identifies the cargo item to be stuffed.</td>
<td>UUID</td>
</tr>
<tr>
<td>Shipping marks</td>
<td>The identifying details of a package or the actual markings that appear on the package(s). This information is provided by the shipper.</td>
<td>Text</td>
</tr>
</tbody>
</table>

Table 37: Cargo line Item entity

**HS Code entity:** HS stands for Harmonized Commodity Description and Coding Systems. The Harmonized System is an international nomenclature for the classification of products. It is used to classify traded goods on a common basis for customs purposes.

The HS codes can be found on the UN statistics website (see [https://unstats.un.org/unsd/tradekb/Knowledgebase/50018/Harmonized-Commodity-Description-and-Coding-Systems-HS](https://unstats.un.org/unsd/tradekb/Knowledgebase/50018/Harmonized-Commodity-Description-and-Coding-Systems-HS)).

### 5.7 Location
The subject area of Location relates to a physical location and/or “UN/LOCODE” (“United Nations Code for Trade and Transport Locations”) from where the shipment is received and to where it is finally delivered. It contains the following entities: Location, Shipment Location, Shipment Location Type, UN Location, Country, Facility and Facility Type. These entities are shown in Figure 19. Location, as identified within the UN Location Code entity, is at a more granular level than the one identified within the Country entity (the Country Code). The location identifier within the Facility entity (the Facility Code), is at an even more granular level than the location provided by the UN Location Code. Also, each Facility must have a Facility Type Code. To make it possible to track the location of an event, the Facility entity is also linked to each of the Event entities for Equipment and Transport. These entities are described in the Event subject area.
The entities within the Location subject area are defined and detailed in the following tables.

**Location entity:** generally used to capture location-related data, also for locations without UN Location Codes.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Location ID</td>
<td>The identifier for a location.</td>
<td>UUID</td>

</tr>
</tbody>
</table>

**UN Location entity:** UN Location is a location as defined by UNECE and commonly known as "UN/LOCODE" ("United Nations Code for Trade and Transport Locations"). The UN Location identifies a location in the sense of a city/town/village, being the smaller administrative area existing as defined by the competent national authority in each country.

A list of all UN location codes can be found in the [UN/LOCODE Code List 2020–1](#).

Table 50: UN Location entity

<th>Country Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>HR</td>
<td>Croatia</td>
</tr>
<tr>
<td>DK</td>
<td>Denmark</td>
</tr>
<tr>
<td>SV</td>
<td>El Salvador</td>
</tr>
</tbody>
</table>

The first two characters of the UN Location Code are the ISO 3166-1 alpha-2 Country Code, which are followed by a three-character code representing a city/town area location within the country. An area containing several functions (port, train station, airport, etc.) should still only have one UN Location Code assigned.

Table 54 contains examples of location names and codes as provided by the UN/ECE linked to the Country Code. Combining the Country Code and the Location Code constitutes the UN Location Code.

Table 57: Shipment Location Type

5.8 Transport
The subject area of Transport describes a movement of a shipment from origin to destination and contains four entities: Transport, Vessel, Mode of Transport and Shipment Transport. These entities are shown in Figure 21. The Transport subject area is modelled around the key entity of Transport for storing specific instances of transport and a subtype (Vessel), which captures vessel-specific details. The Transport entity is linked to The Mode of Transport. The Mode of Transport entity describes the possible modes of transport. The DCSA Transport Type attribute has been added to the Mode of Transport reference data entity to provide shipping industry-specific terminology rather than more generic terms defined by the UN/CEFACT.
The entities within the Transport subject area are defined and detailed in the following tables.

**Mode of Transport entity**: addresses the code specifying the transport mode for the logistic transport movement, following the UN/CEFACT Recommendation 19 – Codes for Modes of Transport mapped to the transport types as defined in the DCSA Glossary of Terms.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode of Transport Code</td>
<td>The code specifying the mode (e.g. transport by rail) for the transport. The code follows UN/CEFACT Recommendation 19 – Codes for Modes of Transport.</td>

<td>The DCSA–defined types of transport as used in events mapped to the Mode of Transport Code.</td>
<td>Text(50)</td>
</tr>
</tbody>
</table>

Table 58: Mode of Transport entity
**Transport entity:** used to convey goods or other objects from place to place, during logistics cargo movements.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transport ID</td>
<td>The unique identifier for the transport.</td>
<td>UUID</td>
</tr>
<tr>
<td>Transport Reference</td>
<td>The reference for the transport, e.g. when the mode of transport is a vessel, the Transport Reference will be the vessel IMO number.</td>
<td>Text(50)</td>
</tr>
<tr>
<td>Transport Name</td>
<td>The name of the transport instance, e.g. for a vessel, this is the vessel name.</td>
<td>Text(100)</td>
</tr>
<tr>
<td>Mode of Transport code</td>
<td>The code specifying the mode of transport.</td>
<td>Text(3)</td>
</tr>
<tr>
<td>Load Transport Call ID</td>
<td>Identifies the departure transport call of the shipment.</td>
<td>UUID</td>
</tr>
<tr>
<td>Discharge Transport Call ID</td>
<td>Identifies the arrival transport call of the shipment.</td>
<td>UUID</td>
</tr>
<tr>
<td>Vessel</td>
<td>The vessel carrying out the transport identified by its IMO number.</td>
<td>Text(7)</td>
</tr>
</tbody>
</table>

Table 59: Transport entity

**Vessel entity:** describes a floating, sea going structure (mother vessels and feeder vessels) with either an internal or external mode of propulsion designed for the transport of cargo and/or passengers. Ocean vessels are uniquely identified by an IMO number consisting of 7 digits, or alternatively by their AIS signal with an MMSI number.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vessel IMO Number</td>
<td>The unique reference for a registered Vessel. The reference is the International Maritime Organisation (IMO) number, also sometimes known as the Lloyd’s register code, which does not change during the lifetime of the vessel.</td>

9 | Transport mode not applicable | The mode of transport in not applicable. | 

Table 62: Mode of Transport

5.9 Events
The subject area of Events contains ten entities. Shipment Event, Equipment Event, Transport Event are the three main entities. The other seven entities are related to the associated reference data: Event Classifier, Shipment Event Type, Shipment Information Type, Empty Indicator, Equipment Event Type, Transport Event Type and SMDG Delay Reason. These entities are shown in Figure 23.

The model design relating to the Equipment, Transport and Shipment Events is based on the Event Structure work that has been published by DCSA. Please refer to the DCSA Event Naming Convention and Event Structure Definitions to obtain more information about the definitions, syntax, parameters, and values for the events.

An event occurs in relation to the central entities of Shipment (for example, Shipment Release Message Issued), Transport (for example, Actual Vessel Departure from Port Terminal), and Equipment (for example, Actual Gate in of Laden Equipment at Port Terminal). These events have been documented by the DCSA Event Naming Convention and Event Structure Definitions supported with DCSA reference data. The Shipment, Transport, and Equipment events have been modelled separately to keep the logical association of what the specific event relates to. For example:

- All types of events relating to shipment are captured in the Shipment Event Type;
- All types of events relating to transport are captured in the Transport Event Type;
- All types of events relating to equipment are captured in the Equipment Event Type.
Each of the above event types can be further related to the estimated, planned, or actual state captured in the Event Classifier entity, and each Event also has specific entities that only relate to those types of events. For example, Equipment Event is related to the Empty Indicator.

The entities within the Events subject area are defined and detailed in the following tables.

**Event Classifier entity**: denotes whether the event is planned, estimated or actual.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event Classifier Code</td>
<td>Code for the event classifier (PLN, ACT or EST).</td>
<td>Text (3)</td>

<tr>
<td>Shipment ID</td>
<td>Unique identifier for the associated shipment.</td>
<td>UUID</td>
</tr>
<tr>
<td>Shipment Information Type Code</td>
<td>The code to identify the type of information that is related to the shipment.</td>
<td>Text (3)</td>
</tr>
</tbody>
</table>

Table 69: Shipment Event entity

### Equipment Event entity

Describes an event that happens to an equipment, e.g. a container loaded onto vessel at port terminal.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Equipment Event ID</td>
<td>Unique identifier for the equipment event captured.</td>
<td>UUID</td>
</tr>
<tr>
<td>Event Created DateTime</td>
<td>The date and time when the event entry was created.</td>
<td>DateTime</td>
</tr>
<tr>
<td>Event DateTime</td>
<td>The date and time when the event occurred or will occur.</td>
<td>DateTime</td>
</tr>
<tr>
<td>Event Classifier Code</td>
<td>The code for the event classifier, e.g., Actual.</td>
<td>Text (3)</td>
</tr>
<tr>
<td>Equipment Event Type Code</td>
<td>The code to identify an equipment-related event type.</td>
<td>Text (4)</td>
</tr>
<tr>
<td>UN Location Code</td>
<td>The UN Location where the event occurs.</td>
<td>Text (5)</td>
</tr>
<tr>
<td>Facility Code</td>
<td>The specific facility where the event occurs.</td>
<td>Text(11)</td>
</tr>
<tr>
<td>Other Facility</td>
<td>An alternative way to capture the facility, when no standardised DCSA facility code can be found.</td>
<td>Text(50)</td>
</tr>
<tr>
<td>Customer Address</td>
<td>An address such as business address or home address.</td>
<td>Text(50)</td>
</tr>
<tr>
<td>Equipment Reference</td>
<td>Reference that uniquely identifies the equipment involved in the event.</td>
<td>Text(15)</td>
</tr>
</tbody>
</table>
### Empty Indicator Code
Code to denote whether the equipment is empty or laden.
- **Data type**: Text (5)

### Shipment ID
Unique identifier for the shipment.
- **Data type**: UUID

### Transport ID
Specifies the transport involved in the event, where applicable. In the case of a load event, this specifies which transport the equipment was loaded onto.
- **Data type**: UUID

#### Transport Event entity:
Describes an event that happens to a transport instance, e.g., a vessel departed.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transport Event ID</td>
<td>Unique identifier for the transport event captured.</td>
<td>UUID</td>
</tr>
<tr>
<td>Event Created DateTime</td>
<td>The date and time when the event entry was created.</td>
<td>DateTime</td>
</tr>
<tr>
<td>Event DateTime</td>
<td>The date and time when the event occurred or will occur.</td>
<td>DateTime</td>
</tr>
<tr>
<td>Event Classifier Code</td>
<td>Specifies the code for the classifier of the event, e.g. Actual.</td>
<td>Text(3)</td>
</tr>
<tr>
<td>Transport Event Type Code</td>
<td>The code to identify the type of event that is related to transport.</td>
<td>Text (4)</td>
</tr>
<tr>
<td>Delay Reason Code</td>
<td>Code for the delay reason as provided by SMDG.</td>
<td>Text (3)</td>
</tr>
<tr>
<td>Change Remark</td>
<td>Free text description of the reason for the change in schedule.</td>
<td>Text(250)</td>
</tr>
<tr>
<td>Transport ID</td>
<td>Specifies the transport involved in the event.</td>
<td>UUID</td>
</tr>
<tr>
<td>Transport Call ID</td>
<td>Specifies the transport call involved in the event.</td>
<td>UUID</td>
</tr>
</tbody>
</table>
**SMDG Delay Reason**: delay reasons as provided by SMDG.

<table>

### 5.10 Vessel Sharing Agreement (VSA)

Vessel sharing agreement is used as an umbrella term to cover the different agreement types that carriers can have in place. The subject area of a VSA contains four entities: Vessel Sharing Agreement, Vessel Sharing Agreement Partner, Vessel Sharing Agreement Type and Tradelane. These entities are shown in Figure 25.

The Vessel Sharing Agreement subject area and its entities will allow for the identification of the partners in a vessel sharing agreement and which Tradelane the agreement relates to. The Vessel Sharing Agreement Type entity defines the different types of agreements, and the Vessel Sharing Agreement is used to outline the specific agreement. The Vessel Sharing Agreement Partner entity identifies the partners in the agreement. The Tradelane entity indicates which directional trade the agreement relates to and is linked to the Service entity (described in the Service subject area) to specify which services are covered in the Tradelane.
The entities within the VSA subject area are defined and detailed in the following tables.

**Vessel Sharing Agreement entity:** describes an agreement between two or more shipping lines to share vessel capacity on specific trades to increase asset utilisation.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vessel Sharing Agreement ID</td>
<td>The identifier for the agreement.</td>
<td>UUID</td>
</tr>
<tr>
<td>Vessel Sharing Agreement Name</td>
<td>The name of the vessel sharing agreement.</td>
<td>Text(50)</td>
</tr>
<tr>
<td>Vessel Sharing Agreement Type Code</td>
<td>The code to identify the specific type of vessel sharing agreement.</td>
<td>Text(3)</td>
</tr>
</tbody>
</table>

Table 79: Vessel Sharing Agreement entity
**Vessel Sharing Agreement Type entity:** identifies a specific type of vessel sharing agreement.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vessel Sharing Agreement Type Code</td>
<td>The code to identify the specific type of vessel sharing agreement.</td>
<td>Text(3)</td>
</tr>
<tr>
<td>Vessel Sharing Agreement Type Name</td>
<td>The name of the specific type of vessel sharing agreement.</td>
<td>Text(50)</td>
</tr>
<tr>
<td>Vessel Sharing Agreement Type Description</td>
<td>A description for a specific type of VSA, as detailed by DCSA.</td>
<td>Text(250)</td>
</tr>
</tbody>
</table>

Table 80: Vessel Sharing Agreement Type entity

**Vessel Sharing Agreement Partner entity:** identifies a participant in a vessel sharing agreement.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vessel Sharing Agreement Partner ID</td>
<td>The unique identifier for the VSA and its partners. The uniqueness of each row is based on the Carrier ID and Vessel Sharing Agreement ID.</td>
<td>UUID</td>
</tr>
<tr>
<td>Carrier ID</td>
<td>Identifies the carrier involved in the VSA.</td>
<td>UUID</td>
</tr>
<tr>
<td>Vessel Sharing Agreement ID</td>
<td>Identifies the VSA.</td>
<td>UUID</td>
</tr>
</tbody>
</table>

Table 81: Vessel Sharing Agreement Partner entity

**Tradelane entity:** describes an East/West or North/South directional trade indicator identifying the geographic area being covered by a specific carrier or service. A Tradelane can have many Services (E.g. Transpacific East-bound).

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tradelane ID</td>
<td>The unique identifier for the Tradelane.</td>
<td>Text(8)</td>
</tr>
<tr>
<td>Tradelane Name</td>
<td>The name of the Tradelane.</td>
<td>Text(150)</td>
</tr>
<tr>
<td>Attribute</td>
<td>Definition</td>
<td>Data type</td>
</tr>
<tr>
<td>-------------------------------------</td>
<td>---------------------------------------------------------------------------</td>
<td>-----------</td>
</tr>
<tr>
<td>Vessel Sharing Agreement ID</td>
<td>The identifier for the vessel sharing agreement.</td>
<td>UUID</td>
</tr>
</tbody>
</table>

Table 82: Tradelane entity

5.10.1 VSA reference data
The figure below shows the reference data entity in the VSA subject area. This entity indicates which type of agreement the partners are involved in.

![Figure 26: VSA reference data entities](image)

The table below contains the Vessel Sharing Agreement Type Code, Name and Descriptions.

<table>
<thead>
<tr>
<th>Vessel Sharing Agreement Type Code</th>
<th>Vessel Sharing Agreement Type Name</th>
<th>Vessel Sharing Agreement Type Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VSA</td>
<td>Vessel Sharing Agreement</td>
<td>An agreement between two or more carriers agreeing to share vessel capacity in specific trades using a specified number of vessels.</td>
</tr>
<tr>
<td>SCA</td>
<td>Slot Charter Agreement</td>
<td>An agreement between two carriers to sell or exchange a specific number of TEU slots in one or more trades.</td>
</tr>
</tbody>
</table>

Table 83: Vessel Sharing Agreement Type

5.11 Service
Services are the central constituents of each carrier’s network. They are typically operated on a weekly schedule. The Service Proforma entity has been modelled on a reduced scope and only allows one version (the latest) to be stored at any point in time, with a limited number of details captured.

The subject area of Service contains two entities: Service and Service Proforma. These entities are shown in Figure 27.
The entities within the Service subject area are defined and detailed in the following tables.

**Service entity:** contains the attributes identifying a given service.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service ID</td>
<td>The unique identifier of the Service.</td>
<td>UUID</td>
</tr>
<tr>
<td>Carrier ID</td>
<td>Unique internal identifier for the carrier.</td>
<td>UUID</td>
</tr>
<tr>
<td>Carrier Service Code</td>
<td>The code for the service. This is unique for each carrier.</td>
<td>Text (5)</td>
</tr>
<tr>
<td>Carrier Service Name</td>
<td>The name of the service as provided by the carrier operating the vessel.</td>
<td>Text(50)</td>
</tr>
<tr>
<td>Tradelane ID</td>
<td>The Tradelane that the service is based upon.</td>
<td>Text(8)</td>
</tr>
</tbody>
</table>

Table 84: Service entity

**Service Proforma entity:** identifies the Proforma that the VSA Partners have agreed to. The actual port rotation that is carried out by the vessel.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service Proforma ID</td>
<td>The unique identifier for a Service Proforma.</td>
<td>UUID</td>
</tr>
<tr>
<td>Service Proforma Agreed DateTime</td>
<td>The date when all vessel sharing agreement partners have agreed to the new Proforma.</td>
<td>DateTime</td>
</tr>
<tr>
<td>Attribute</td>
<td>Definition</td>
<td>Data type</td>
</tr>
<tr>
<td>------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-----------</td>
</tr>
<tr>
<td>Port Call Sequence Number</td>
<td>The port number in the sequence of ports that are or will be called on a voyage, as defined in the proforma prior to the voyage. This is useful for identifying a unique call, when calls are made to the same port more than once.</td>
<td>Number</td>
</tr>
<tr>
<td>Port Code</td>
<td>Identifies the port being called as a UN Location code.</td>
<td>Text (5)</td>
</tr>
<tr>
<td>Port Terminal Call Sequence Number</td>
<td>The Port Terminal number in the sequence of port terminals that are or will be called on a specific port call (as identified by the Port Call Sequence Number). This is useful to identify a unique port terminal call when calls are made to the same terminal more than once.</td>
<td>Number</td>
</tr>
<tr>
<td>Port Terminal Code</td>
<td>Identifies the port terminal being called as an SMDG port terminal code.</td>
<td>Text(11)</td>
</tr>
<tr>
<td>Service ID</td>
<td>The identifier of the Service.</td>
<td>UUID</td>
</tr>
</tbody>
</table>

Table 85: Service Proforma entity

### 5.12 Transport Journey
The subject area of Transport Journey contains five entities: Transport Call, Voyage, Transport Call Voyage, Commercial Voyage and Commercial Voyage Transport Call. These entities are shown in Figure 28.
The entities within the Transport Journey subject area are defined and detailed in the following tables.

**Transport Call entity**: provides a list of all the locations involved in a transport journey.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transport Call ID</td>
<td>The unique identifier for a Transport Call.</td>
<td>UUID</td>
</tr>
<tr>
<td>Transport Call Sequence Number</td>
<td>Transport operator’s key that uniquely identifies each individual call. This key is essential to distinguish between two separate calls at the same location within one voyage.</td>
<td>Number</td>
</tr>
<tr>
<td>Facility Code</td>
<td>The facility where the call occurs.</td>
<td>Text(11)</td>
</tr>
<tr>
<td>Facility Type Code</td>
<td>Code that identifies the type of facility.</td>
<td>Text(4)</td>
</tr>
<tr>
<td>Other Facility</td>
<td>An alternative way to capture the facility details, when no standardised DCSA facility code can be found.</td>
<td>Text(50)</td>
</tr>
<tr>
<td>Customer Address</td>
<td>Free text to capture the customer address, where applicable.</td>
<td>Text(250)</td>
</tr>
</tbody>
</table>
### Attribute | Definition | Data type
--- | --- | ---
Location ID | The associated location ID defined in the Location entity. | UUID

**Voyage entity:** describes the part of a service roundtrip that typically changes at the geographical “end-point” of a vessel rotation. As such, that specific port call can have two voyage numbers: one for the discharge of final shipments on the “current” voyage, and one that identifies the commencement of loading shipments (for allocation purposes). One rotation will typically have 2 voyages, one on each haul.

### Attribute | Definition | Data type
--- | --- | ---
Voyage ID | The identifier of the Voyage. | UUID
Carrier Voyage Number | The vessel operator-specific identifier of the Voyage. | Text(50)
Service ID | The identifier of the Service. | UUID

**Transport Call Voyage entity:** provides a list of all locations involved in a voyage.

### Attribute | Definition | Data type
--- | --- | ---
Voyage ID | The identifier of the Voyage defined in the Voyage entity. | UUID
Transport Call ID | Identifies the transport call that relates to the voyage. | UUID

**Commercial Voyage entity:** defines the service and the voyage from a commercial perspective and is required to accommodate having the correct voyage number on the booking confirmation and transport document.

### Attribute | Definition | Data type
--- | --- | ---
Commercial Voyage ID | The identifier of the Commercial Voyage | UUID
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Commercial Voyage Name</td>
<td>Identifies the commercial voyage as shown on the booking and the transport document</td>
<td>Text</td>
</tr>
</tbody>
</table>

Table 89: Commercial Voyage entity

**Commercial Voyage Transport Call entity**: expresses that each commercial voyage contains multiple transport calls.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transport call ID</td>
<td>Identifies the transport call that relates to the voyage.</td>
<td>UUID</td>
</tr>
<tr>
<td>Commercial Voyage ID</td>
<td>The identifier of the Commercial Voyage</td>
<td>UUID</td>
</tr>
</tbody>
</table>
